WASHABLE INCONTINENCE UNDERWEAR

! CHOOSE LIFE – NOT LEAKS!

Absorption rates vary from 150ml to 300ml to 650ml depending on the style

TO MATCH THE VOLUME OF LEAKAGE

Can be washed and reused between 200 and 250 times

NHS SUPPLY CHAIN CATALOGUE

Prevalence of Incontinence

Across a range of UK studies, the prevalence of any **incontinence** averages out at around 40% for women and 10% for men. **Incontinence** with impact on life is estimated to be around 30% for women. For those aged 40 or more, storage disorder as a whole **affects** around 39% of women and 29% of men.

The number of people aged 65 and over will increase by more than 40% within 20 years, and the number of households where the oldest person is 85 and over is increasing faster than any other age group. These changes have profound implications for each of us, as well as for government, business and civil society.

► (Office of National Statistics, (2017), Principal projection – UK population in age groups, mid-2017 based.)

Technical

Absorbent washable products usually comprise three main layers: an absorbent core sandwiched between a water-proof backing beneath and a water-permeable coverstock (or *topsheet*) next to the wearer's skin.

Washable absorbent cores are usually made from a needlefelt or knitted fabric comprising rayon and/or polyester fibres. A variety of polymers are used for the water-proofing. In general, the thicker, stiffer materials are more durable (*the durability of the plastic backing often determines the lifetime of the product*) but less comfortable.

Top sheets are usually made from either cotton – which is hydrophilic and intended to have good dry comfort, or polyester – which is hydrophobic and intended to have good wet comfort.

Patient Selection

Selecting suitable continence products is critical for the well-being and quality of life of patients and their carers.

The ability to contain and conceal incontinence enables individuals to protect their public identity as a “continent person” and avoid the stigma associated with incontinence.

Failure to do so can result in limited social and professional opportunities, place relationships in jeopardy and detrimentally affect emotional and mental wellbeing.

The ability to contain and conceal incontinence enables carers to feel confident that the person(s) they care for will not be embarrassed publicly. It reduces the level of care required in relation to maintaining hygiene, skin care and laundry for the person who is dependent upon continence products.

When do Washable Pants Work Best?

Washable pants may provide adequate absorbency during the day for some men and women with light to moderate bladder leakage, or those who experience only occasional light leakage (*perhaps just after urinating*) and want some form of protection “just in case”. They are very good at staying in place and are a relatively discreet product, and so are most popular for men and women who are particularly active.

Overnight use is better suited for men and women who sleep on their backs with light leakage. When selecting pads, consider whether they are the right size, the right absorbency, and whether the patient and/or their carers/relatives can manage them (Fader et al, 2008). The right size is necessary because if the pad is too small it could leak and be uncomfortable to wear, if too large they could cause pressure damage to the skin and

be uncomfortable. It is important to measure patient's waist (*MEN*) and hips (*WOMEN*) during a continence assessment.

Ensure sufficient absorbency is indicated to reduce leakage risk, which could damage a patient's skin integrity. Patients may need more absorbent pads for night time use; patients may go much longer between pad changes at night, and also the volume of urine passed can change during the course of the day. Weavever produce pads tailored to the male and female anatomy: more padding at the front for men and more padding in the middle for women.

Sustainability

Sustainable healthcare is a major goal both worldwide and for the NHS, where single-use products are a key contributor to plastic waste (Sustainable Development Unit, 2020). Incontinence management is heavily dependent on single-use products; mainly plastic-backed disposable pads and other products containing non-biodegradable plastics, such as urinary drainage sheaths and catheters. These containment products are essential for people with intractable incontinence: their dignity, quality of life, independence and physical health depend on them (Cottenden et al, 2017). The number of single-use continence products used per annum is hard to estimate, but it is a large and growing market estimated to be worth US\$12.9bn (£10.3bn) across 41 countries in 2018 and is expected to increase to US\$15.8bn (£12.6bn) by 2026 (Absolute Reports, 2020).

NHS Inform (2020) estimates that three million to six million people in the UK experience urinary incontinence and that demand for continence products is likely to rise because risk factors for incontinence are increasing. Risk factors include advancing age, lifestyle factors, dementia, complex comorbidities and obesity.

The Three Rs: Reduce, Reuse, Recycle

With origins in the American ‘Earth movement’ of the early 1970s, the three Rs are often used as a framework to consider ways of reducing waste. They are now part of day-to-day environmental language: “reduce the amount of waste created, reuse items that could have a future purpose and recycle whenever possible” (Recycle Nation, 2015). In continence care, reducing or curing incontinence is the most desirable goal.

Assessment interventions to prevent and reduce incontinence should, therefore, be the highest priority. Appropriate reassessment of an individual's continence product requirements, using validated tools where available (Yearwood-Martin et al, 2018), can help reduce the number of products used, avoiding over-supply and product waste.

The ‘mix and match’ approach requires users to be offered, and encouraged to consider using more than one product variant or design, including both reusable and single-use products. Although the approach is most suitable for men – for whom there is a more diverse range of products available, it also applies to women.

Mix and Match: Most studies of continence products show that one product type does not suit an individual at all times, and the concept of a ‘mix and match’ of products has been shown to be preferred by both women (Fader et al, 2008) and men (Macaulay et al, 2015). This term refers to using different products: At specific times of the day or night.

A more sustainable approach to continence product provision currently depends on a reduction in use of single-use products, use of longer-lasting versions, and their substitution with reusable alternatives. There are advantages and disadvantages to both reusable and single-use products and a ‘mix and match’ approach is key. For many people, the introduction of reusable products may be acceptable, but only in combination with other single-use versions. Working towards strategies for sustainability in continence care; such as reduce, reuse, recycle – requires a thorough understanding of the lifecycle of products and associated processes. It is the responsibility of us all, including product manufacturers, policymakers, purchasing agencies, prescribers, researchers, health professionals and end users. Over recent years, the focus has largely been on the development of single-use products.

Environmental

COMPARING ENVIRONMENTAL IMPACTS BETWEEN DISPOSABLE DIAPERS AND REUSABLE CLOTH UNDERWEAR

Although both Cloth and disposable diapers both have environmental impacts, such as the consumption of natural resources, energy usage, health issues, air and water pollution and waste disposal, the damaging impact from cloth diapers is smaller than that of disposable diapers.

Environmental Impact From Manufacturing

Knowing that disposal diapers are made with wood pulp, oil and plastics, whereas cloth is made of cotton, choosing cloth instead of disposable diapers represents a significant way to reduce oil and tree consumption.

The manufacturing of disposable diapers uses 37% more water than home laundered reusable cloth underwear and requires nearly 6 times the amount of energy used in manufacturing reusable diapers. Cloth diapers use less renewable and non-renewable resources at all levels of production and use than do disposables.

Most studies agree that the air pollution from the manufacture of disposables is far more noxious than the air pollution from the production and use of cloth diapers, because it includes dangerous chemicals, such as sodium polyacrylate, chlorine, dioxin, TBT that are released into the environment, contributing to water and air pollution and global warming.

Environmental Impact From Product Disposal

Billions of diapers end up in landfills* (*an estimated three billion disposable adult and baby are thrown away every year in the UK, accounting for 2-3% of all household waste, according to recycling charity wrap*) and during the decomposition of disposable diapers methane is released in the air, which significantly contributes to global warming. Disposable diapers have a negligible recycling rate. The absorbent gels and plastic components found in disposal diapers need at least 500 years to decompose.

Instead of resorting to landfills, some countries burn them which contributes to air pollution. Human waste can leach in to

waterways and cause contamination or spread communicable diseases (*Hep B/Polio*). On the other hand, cotton diapers are made from mostly renewable resources which decompose quickly. Even when Polyester is used, which takes much longer to decompose – the volume of material produced per patient is considerable less compared to disposables.

Conclusion

There are lots of environmental reasons to feel good about choosing cloth underwear over disposable diapers. The fact that one patient may use a maximum of 7 reusable incontinence underwear's per year versus up to perhaps 1000 adult disposable diapers in one year reduces significantly the environmental impacts from manufacturing, especially compared to the more negative impacts caused by the manufacturing of disposal diapers.

*See statistics from EPA on yearly amounts of disposal diapers in landfills.

Wearever Washables

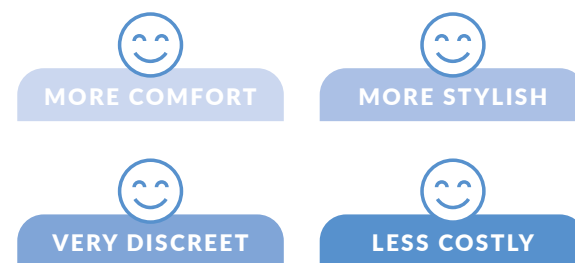

Wearever offers ground breaking undergarments for people with urinary incontinence, providing a reusable, washable alternative to adult diapers. The men's briefs and women's panties are especially beneficial for active individuals who want to continue their normal lifestyle without worry or emotional stress resulting from incontinence. Featuring a diverse range of styles (Classic Brief/Boxer Brief/Boxer for MEN & Mid Rise/Bikini Cut/Lace/High Leg/Banded Leg/Cotton Comfort/Full Cut Panties for WOMEN) and colours (White/Blue/Dark Grey) with sizes up to 5X - Wearever absorbent products have a Triple Layer Hydrex System: a top sheet that wickers moisture away from the skin, and a core area that locks in the moisture, with a waterproof outer layer - give your patients the chance to get outdoors and be active again or simply relax with confidence at home.

Wearever can be washed and reused between 200-250 times, resulting in a cost per day in pennies. Wearever garments come in a variety of woven materials, allowing perspiration to evaporate from the skin, keeping the skin cooler and minimizing the conditions for skin maceration and break down.

Wearever garments are sized to fit and mold to body contours. They are woven without rigid seams or pressure points. The feel and comfort is the same as one's ordinary undergarment.

Wearever garments are worn as normal underwear. There are no special devices or inserts. Simply slip them on to wear and launder as you would normal underwear.

Initial Preparation & Washing

Wash the garment once before using. Underwear can be washed in a normal wash cycle without bleach or fabric softener. Ensure garment is thoroughly dry before application to the body.

Skin Health

Wearever are woven and breathes through large pores, e.g. allows perspiration to evaporate from the skin, keeping the skin cooler and minimizing the conditions for skin maceration and break down. Incorporating Silver Ion Impregnated Fibers in the garment inhibits bacterial growth helping to control odour.

Comfort

Wearever are sized to fit and to mold to body contours. They are woven without rigid seams or pressure points. The feel and comfort is the same as one's ordinary undergarment.

Convenience

Wearever are worn as normal underwear. There are no special devices or inserts. Simply wear and launder as you would normal underwear. Multiple use means less storage space required and less effort to dispose when needed.

Security and Freedom

Wearever Washables allows the user to wear normal fitting underwear that serves to help manage leaks. Because it fits/functions as normal underwear, the user need not worry about public perception.

iMEDicare

Commitment

When dealing with incontinence, iMEDicare believes that the patient user should be firmly at the centre of all care giver interactions, and that patient dignity and comfort is paramount.

We are aware that the cost of continence products can be a big strain on the budget of any healthcare provider institution, therefore we offer smarter re-useable solutions to help you manage this budget more effectively.

All iMEDicare representatives are enhanced DBS cleared with level three Medical Industry Association certification. We offer a free home/hospital trial fitting service on request with dedicated patient support and follow-up either in person or by GDPR compliant tele-video communications and information transfer systems. We cover all regions of the UK and Ireland.

Call 01923 23 77 95 (Mon-Fri 8am to 5pm) or email contact@imedicare.co.uk to request patient trial of Wearever.

Placing an Order With NHS Supply Chain

TO BEGIN ORDERING YOU WILL NEED AN ACCOUNT

If you are an NHS customer please contact your Trust Administrator. If you are unsure who your Trust Administrator is, contact customer.service@supplychain.nhs.uk.

Non NHS customers should contact our Customer Services team on **0845 680 2439** or csadmin@supplychain.nhs.uk for more information.

Before placing your order with NHS Supply Chain, you will need to choose your products from our online catalogue on our website:

my.supplychain.nhs.uk/catalogue

Once you have identified all of the products you require, you are ready to place your order with us through one of our ordering routes:

- ▶ **Our online catalogue and ordering system**
- ▶ **Electronic Data Capture (eDC) or Electronic Data Capture Gold (eDC Gold)**
- ▶ **Electronic file transfer via NHS.net**
- ▶ **Electronic Data Interchange (EDI)**
