What is Erectile Dysfunction?
The inability to achieve sexual relations with your partner: erectile dysfunction (ED) affects as many as 1 in 5 men and becomes more common with age, especially for those with conditions such as diabetes, high blood pressure, or heart disease. Concern about loss of function or the role of sexual intimacy in your relationship can cause a great deal of distress and reduced quality of life to those affected. However, today’s world, erectile dysfunction is treatable.

How can Vacuum Therapy Help?
SOMArectum Therapy is the safe and most consistently successful non-surgical treatment option for your ED problem, applicable in any setting. Globally proven to work for over 50% of men, SOMArectum’s Vacuum therapy has been reviewed by the unimpeded side-effects associated with long term medications. Visual symptoms, fewer side-effects and significantly more cost-effective over the longer term. This fact alone will make you use SOMArectum device as often as you want.

How does it Work?
The penis is positioned inside the device cylinder. Pumping around it 15-20 times per second, blood flows into the penis creating a full rigid erection. An Erection Maintenance Timer, transferred from the device cylinder to the base of the penis, against the very base of the cylinder allows full control, and intercourse to take place. The ring will hold the erection firmly for as long as 15-20 minutes, even after orgasm, and permit ejaculation in almost all cases. The erection will gradually return to normal, without further pumping.

Daily SOMArectum Vacuum Therapy: application for 30 minutes 4-5 times a day; during the week: 5-20 minutes, 2-3 times a day. 3. Weekly general check-up 3. Sexual activity each month after initiation of program. 4. Continuous therapeutic SOMArectum application alternative in the longer term

Rehabilitation Protocol for Men with Prostate Cancer Treatment
Functional Sexual Recovery Clinic has shown that regular use of SOMArectum vacuum therapy device following a prostatectomy or other prostate cancer treatment facilitates an earlier return to sexual intimacy, increased sexual craving, recovery of penile tissue and sexuality, and potentially, an earlier return of natural erections. The study involves a device group and a control group. The device group received SOMArectum Vacuum Therapy Device. It is believed that the diminishing function of the penis may be enhanced, and hence, help patients with the increased in addition to treat the symptoms of erectile dysfunction. It was found that the long-term retrogade ejaculation is one of the key factors for the first set of experiments where the data were added to the normal device group. The device group used with the SOMArectum device on a regular basis (daily therapy). In 6-month trial, 92% reported a significant improvement in sexual function and satisfaction.
